No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB seq length: 0

The polypeptide is capable of binding the flt3 receptor and is: a) amino acids 28 x of murine flt3 ligand (flt3-L), where x is an amino acid between 163-231; b) amino acids 28 y of human flt3-L, where y is an amino acid between 160-235; and c) a polypeptide that has at least 90% identity to the polypeptides of either (a) or (b). The method ameliorate the effects of autoimmune diseases, food allergies or organ or tissue rejection following transplantation. Administration of flt3-L allows lower doses of antigens to be used in vivo for mucosally administered antigens. The present

                                                                                                                                                                                                                                                                                                            В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (this sequence) or mature (AANS9720) flt3-L polypeptides. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein can be used to induce cellular capacitally in vivo) or differentiation of hematopoietic expansion (especially in vivo) or differentiation, e.g. 'ln'.') the mematopoietic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interlepkins, colony stimulating. Capacitors or protein kinases. The protein fanglase modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or immunosuppression). The protein may be used to treat a pathological condition e.g. myslodysplasia. The protein capacitic anemia, HTV infection, breast, small cell lung, testicular or ovarian cancer, lymphoma, multiple mysloma, 'neuroblastoma or acute'.

                                                                                                                                                                                                                 The present sequence is that of human Fms-like tyrosine kinase (Flt-3 ligand). The invention is directed to enhancing the immune response of a vertebrate to an antigen or a cytokine by administering in vivo, into a tissue of a vertebrate, a Flt-3 ligand-encoding polynucleotides, and 1 or more antigen- or cytokine-encoding polynucleotides. The Flt-3 ligand-encoding polynucleotides are nicely folynucleotide may encode the present full-length human Flt-3 cytopy for the ligand. The polynucleotides are incorporated into the cells of the vertebrate in vivo, and a prophylactically or therapeutically effective amount of Flt-3 ligand and 1 or more antigens or cytokines is produced in vivo. Pharmaceutical compositions comprising the polynucleotides are useful for suppressing tumour growth in a mammal. The tumour is melanoma, glioma or lymphoma, particularly B-cell lymphoma. They can also be used for the prophylactic and/or therapeutic treatment of:

(a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis B and C in humans), parasitic (e.g. malaria) and fungal infections; (b) autoimmune diseases (e.g. rhemmatoid arthritis B and osteoarthritis); (c) cancer; and (d) Aujeszky's disease in pigs. Various other examples of these diseases are given in the
                                                                                                                    Matches
                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic compositions comprising Flt-3 ligand encoding polynucleotide and one or more antigen, or cytokine encoding polynucleotides, useful for suppressing tumour growth and for autoimmune diseases (e.g. rheumatoid arthritis)

CF of invention relates to treating an individual at risk for or suffering convergence of involves administering a combination of two to the agents compositions of convolves administering a combination of two to the agents compositions (c) dendritic cell mobilisation factor; (b) dendritic cell maturation agent; (c) dendritic cell activation agent; (d) The dell anthurcing factor; (c) agent; (e) activated, antigen-specific T cells. The methods are useful for treating an individual at risk for or suffering from infection with a pathogenic or opportunistic organism, and the conversion of the cell agents of cell. In the cell agent which causes chaga's disease). The methods are especially centancing a lymphocyte-mediated immune response. In particular, the method is useful for treating inflammations, chickenpox, oral or genital herpes, mononucleosis, multifocal leukoencephalopathy, hepatitis, AIDS, cell leukemia or T cell lymphoma. The activated antigen-presenting cell dendritic cells are useful as a vaccine adjuvant. The present sequence cerpresents a human FIL3L polypeptide fragment, that can be used as a cell dendritic cell mobilisation factor.

                                            A cDNA library from the human stromal cell line 295V48, in pME185, was screened with an 800 bp fragment derived from mouse clone T118. This fragment encompasses the coding region conserved between two mouse clones, T118 and T110. Approx. 20 positive clones were selected and partially sequenced. Two clones, S86 and S109, were found to be approx. 75% homologous to the mouse clones over the first 163 AAs. Clone S86 continued to show homology to T110 until the stop codon, although to a lesser degree, for an overall homology of 66%. Clones T18 and S109 do not show homology to each other or to the other clones after mouse residue 163 (human residue 160). An additiona mouse clone designated MB8 has a 29 AA insert at the junction between the common and divergent portions of the mouse ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19-MAY-1993;

```
cc administering in vivo, into a tissue of a vertebrate, a Flt-3 cc ligand-encoding polynucleotide, and 1 or more antigen or cytokine-encoding polynucleotides. The Flt-3 ligand-encoding Cc cytokine-encoding polynucleotides. The Flt-3 ligand-encoding Cc ligand polypeptide, or amino acids 27-185, 1-185, 27-235 or 1-235 cc ligand polypeptide, or amino acids 27-185, 1-185, 27-235 or 1-235 cc of the Flt-3 ligand. The polynucleotides are incorporated into Cc the cells of the vertebrate in vivo, and a prophylactically or cc therapeutically effective amount of Flt-3 ligand and 1 or more cc antigens or cytokines is produced in vivo. Pharmaceutical compositions comprising the polynucleotides are useful for suppressing tumour growth in a mammal. The tumour is melanoma, Cc glioma or lymphoma, particularly B-cell lymphoma. They can also be used for the prophylactic and/or therapeutic treatment of:

(a) bacterial (e.g. Bacillus infections), viral (e.g. hepatitis B and contains), parasitic (e.g. malaria) and fungal infections; cb used cin humans), parasitic (e.g. malaria) and fungal infections; costeoarthritis); (c) cancer; and (d) Aujeszky's disease in pigs. Contains other examples of these diseases are given in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides CC which exhibits increased or decreased biological activity relative to CC the full length wild type (AAY69719) or mature (AAY69720) flt3-L CC polypeptides. This sequence represents an example of the novel fit-3 CC ligands and comprises the L-3H mutant polypeptide. The flt3-L protein CC binds cell surface tyrosine kinase receptors and regulate growth and CC differentiation of hematopoietic progenitor cells. The flt3-L protein can CC be used to induce cellular expansion (especially in vivo) or dendritic CC cells, especially in the presence of growth factors such as interleukins, CC colony stimulating factors or protein kinases. The protein can also CC modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, can mail cell lung, testicular or ovarian cancer, lymphoma, multiple CC myeloma, neuroblastoma or acute leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                 Ş
                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides CC which exhibits increased or decreased biological activity relative to the full length wild type (AAK69719) or mature (this sequence) flt3-L CC polypeptides. The flt3-L protein binds cell surface tyrosine kinase creeptors and regulate growth and differentiation of hematopoletic progenitor cells. The flt3-L protein can be used to induce cellular CC expansion (especially in vivo) or differentiation, e.g. in the CC hematopoletic, natural killer (NK) or dendritic cells, especially in the CC hematopoletic, natural killer (NK) or dendritic cells, especially in the CC presence of growth factors such as interleukins, colony stimulating CC factors or protein kinases. The protein can also modulate, augment, or CC disorder (e.g. allergy, autolamunity or immunosuppression). The protein CC disorder (e.g. allergy, autolamunity or immunosuppression). The protein CC may be used to treat a pathological condition e.g. myelodysplasia, CC aplastic anemia, HTV infection, breast; small cell lung, testicular or covarian cancer, lymphoma, multiple myeloma, neuroblastoma or acute
                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                     The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides (C which exhibits increased or decreased biological activity relative to the full length wild type (AAY69719) or mature (AAY69720) flt3-L (C polypeptides. This sequence represents an example of the novel flt-3 (C ligands and comprises the K84E mutant polypeptide. The flt3-L protein C binds cell surface tyrosine kinase receptors and regulate growth and C differentiation of hematopoletic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or (c differentiation, e.g. in hematopoletic, natural killer (NK) or dendritic (c cells, especially in the presence of growth factors such as interleukins, (C colony stimulating factors or protein kinases. The protein can also modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or immunosuppression). The protein may be used to treat a pathological (c condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, c mall cell lung, testicular or ovarian cancer, lymphoma, multiple

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                 The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAY69719) or mature (AAY69720) flt3-L propertides. This sequence represents an example of the novel flt-3 colligands and comprises the Q122R mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and colligands and comprises the Q122R mutant polypeptide. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or dendritic collis. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or cells, especially in the presence of growth factors such as interleukins, colony stimulating factors or protein kinases. The protein can also modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or immunosuppression). The proterin may be used to treat a pathological condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, consultations, neuroblastoma or acute leukenia.
                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Q
The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to CC the full length wild type (AN469719) or mature (AN469720) flt3-L CC polypeptides. This sequence represents an example of the novel flt-3 CC ligands and comprises the L26F mutant polypeptide. The flt3-L protein CC binds cell surface tyrosine kinase receptors and regulate growth and CC differentiation of hematopoietic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or CC differentiation, e.g. in hematopoietic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins, CC colony stimulating factors or protein kinases. The protein can also CC modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or condition e.g. myelodysplasia, aplastic anemia, HTV infection, breast, condition e.g. myelodysplasia, aplastic anemia, HTV infection, breast,
                                                                                                                                                                                                                                                                                                                                                    Mutant soluble flt3 ligand polypeptide used in cellular expansion, immune response stimulation or treatment of pathological conditions contains amino acid substitutions at positions 8, 84, 118 or 122 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunomodulator; immunosuppressive; cytostatic; antianemic; anti-HTV; neuroprotective; antiallergic; flt3 ligand; flt3-L; wild type; allergy; cell surface tyrosine kinase receptor; hematopoletic progenitor cell; cellular expansion; cellular differentiation; natural killer cell;

The invention relates to novel soluble flt3 ligand (flt3-L) polypeptides which exhibits increased or decreased biological activity relative to the full length wild type (AAY69719) or mature (AAY69720) flt3-L polypeptides. This sequence represents an example of the novel flt-3 ligands and comprises the L26F mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoietic progenitor cells. The flt3-L protein cal
                                                                                                                                                                                                                                                             Mutant soluble flt3 ligand polypeptide used in cellular expansion, immune response stimulation or treatment of pathological conditions contains amino acid substitutions at positions 8, 84, [18 or 122]
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens

The protein can also modulate, augment or enhance a patient's immune response and can be used to treat an immune disorder (e.g. allergy, autoimmunity or immunosuppression). The protein may be used to treat a pathological condition e.g. myelodysplasia, aplastic anemia, HIV infection, breast, small cell lung, testicular or ovarian cancer, lymphoma, multiple myeloma, neuroblastoma or acute leukemia.

This sequence represents an example of the novel flt-3 ligands and comprises the HBY mutant polypeptide. The flt3-L protein binds cell surface tyrosine kinase receptors and regulate growth and differentiation of hematopoletic progenitor cells. The flt3-L protein can be used to induce cellular expansion (especially in vivo) or differentiation, e.g. in hematopoletic, natural killer (NK) or dendritic cells, especially in the presence of growth factors such as interleukins, colony stimulating factors or protein kinases. The protein can also modulate, augment or enhance a patient's immune response and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to treat an immune disorder (e.g. allergy, autonimunity or immunosuppression). The protein may be used to treat a pathological condition e.g. myelodysplasia, aplastic anemia, HIV infection, bream small cell lung, testicular or ovarian cancer, lymphoma, multiple
